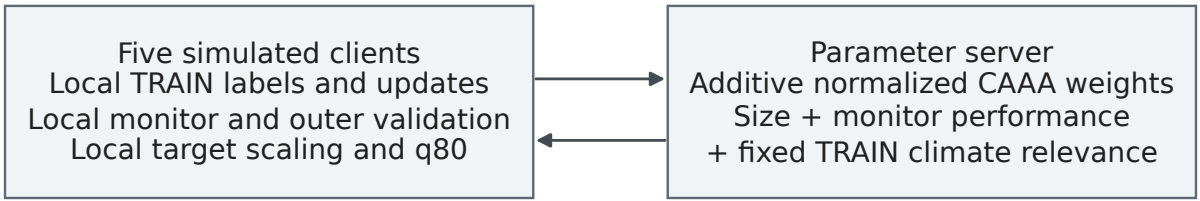
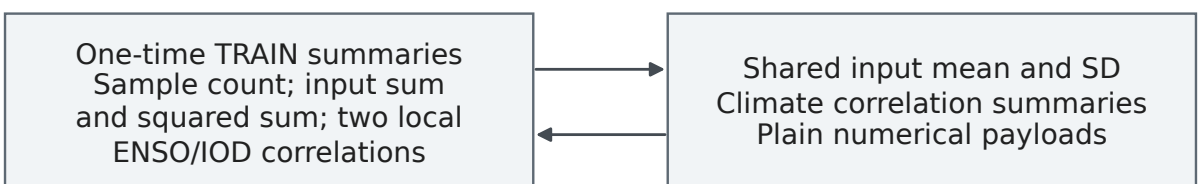
CAAA messages in a one-process simulation



Each round: states, scalar monitoring/validation diagnostics,
and two fixed whole-TRAIN strengths. Broadcast the global model.



Upload input statistics and climate summaries.
Broadcast the input mean and SD once.

Reporting exports: target mean and SD (16 bytes/client).
TRAIN q80 appears in schema and evaluation diagnostics.

Primary aggregation coefficients: (1, 0, 0); anchor: (0.3, 0.3, 0.4).

No secure aggregation or differential privacy is implemented.
Graph controls separately require aligned TRAIN rainfall sharing.
Central and static-router controls use declared raw-data pooling.
