

Calendar support for a target month t issued at00:00 UTC on its first day. Historical origins span t−12 through t−1. Rainfall features include lags1,2,5,11 relative to each origin and trailing3/6/12-month statistics ending one month before it, giving combined CHIRPS support t−24 through t−2. Climate period ends span t−13 through t−2; the underlying overlapping ONI and MEIv2 periods begin at t−15 and t−14. Meteorological inputs span t−15 through t−4. Known season harmonics do not use observed target rainfall. The prespecified availability sensitivity delays observed inputs by one further month. These support rules avoid using future observations but are archive-availability assumptions, not established real-time product vintages or optimized physical propagation lags.
